CORACTOR: Calcium-dependent (By similarity).
ENZYME REGULATION: Inhibited by divalent copper and zinc ions, but not by nickel or cobalt. Inhibited by its prosegment, but not smaller fragments thereof (By similarity).
SUBCELLULAR LOCATION: Type I membrane protein; endoplasmic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       reticulum and Golgi. May sort to other organelles, including lysosomal and/or endosomal compartments (By similarity).

PTM: The 148 KDa zymogen is professed progressively into two membrane-bound 120 and 106 kDa forms in the endoplasmic reticulum, and late into a secreted 98 kDa form. The propeptide is autocatalytically removed through an intramolecular cleavage after Leu-186. Further cleavage generates 14, 10, and 8kDa intermediates (By similarity).

SIMILARITY: BELONGS TO PEPTIDASE FAMILY S8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          InterPro; IPR000209; Peptidase_S8.

B 47:707-730(1991).

-I- FUNCTION: SUBTILISIN IS AN EXTRACELLULAR ALKALINE SERINE PROTEASE,
-I- CATALYZES THE HUDROLYSIS OF PROTEINS AND PEPTIDE AMIDES.
-I- CATALYZES THE HUDROLYSIS OF PROTEINS WITH broad specificity
for peptide bonds, and a preference for a large uncharged residue
in PI Hydrolyzes peptide amides.
-I- SUBCELLULAR LOCATION. Secreted.
-I- SUBCELLULAR LOCATION OF SUBTILISIN IS ASSOCIATED WITH ONSET OF
SPORULATION, AND MANY WITATIONS WHICH BLOCK SPORULATION AT EARLY
STAGES AFFECT EXPRESSION LEVELS OF SUBTILISIN. HOWEVER, SUBTILISIN
IS NOT NECESSARY FOR NORWAL SPORULATION.
                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           X-RAY CRYSTALLOGRAPHY (2.0 ANGSTROMS).

Proteases involved in generation of beta- and alpha-amylases from a large amylase precursor in Bacillus polymyxa.;
J. Bacteriol. 173:6820-6825(1991).
- FUNCTION: INVOLVED IN THE GENERATION OF BETA- AND ALPHA-AMYLASES FROM THE LARGE AMYLASE PRECURSOR.
-- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S8.

"Purification, characterization, and molecular modeling of pyrolysin and other extracellular thermostable serine proteases from hyperthermophilic microorganisms.";
Meth. Enzymol. 330:383-393(2001).
-! FUNCTION: Has endopeptidase activity toward caseins, casein fragments including alpha-Sl-casein and synthetic peptides.
-! SUBCELLUIAR LOCATION: Cell-envelope associated.
-! PTM: LWM pyrolysin seems to be produced by autoproteolytic activation of HWW pyrolysin.
                                                                                                                                                                                                                                                                   Archaea; Euryarchaeota; Thermococci; Thermococcales; Thermococcaceae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -1- PTM: Glycosylated.
-1- MISCELLANEOUS: Thermostable; high activity at 95 degrees Celsius.
-1- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S8.

C. Comment: 1-2;12-71;22-74;27-29;43-45;93-95;123;135-137;140-142;169-171;183-187;221;23

C. Comment: a Comment of Subtilisin is associated with the onset of sporulation, and many not necessary for normal sporulation.

C. Superfamily: subtilisin; subtilisin homology

C. Keywords: extracellular protein; hydrolase; serine proteinase
